Histological Typing of Testis Tumours (WHO. World Health Organization. International Histological Classification of Tumours) F.K. Mostofi, Isabell A. Sesterhenn

This classification is based primarily on the presence of morphologically identifiable cell types and growth patterns that can be correlated with the clinical behaviour of the tumour and, in some cases, with tumour markers in the serum. Although some of the histological terms and definitions have histogenetic implications, this classification is not meant to be histogenetic. The terminology adopted for individual tumours is based on their general acceptance and world-wide usage. Synonyms are included only if they have been widely used in the literature or if they are considered helpful in understanding the lesions. Controversial histogenetic terms have been avoided whenever possible. The term tumour is used synonymously with neoplasm. The term tumour-like is applied to non-neoplastic lesions which clinically or morphologically resemble neoplasms; they are included in this classification because of their importance in differential diagnosis. Because of the many similarities between testis tumours and those of the ovary, an attempt has been made to follow the WHO histological typing of ovarian tumours.

Histological Classification of Testis Tumours

1 Germ Cell Tumours

1.1 Precursor lesions - intratubular malignant germ cells

1.2 Tumours of one histological type (pure forms)

1.2.1 Seminoma 9061/3

1.2.1.1 Variant - Seminoma with syncytiotrophoblastic cells

1.2.2 Spermatocytic seminoma 9063/3

1.2.2.1 Variant - Spermatocytic seminoma with sarcoma

1.2.3 Embryonal carcinoma 9070/3

1.2.4 Yolk sac tumour 9071/3

Polyembryoma
