Antibody Fc: Chapter 11. Activating and Inhibitory Fc γ Rs in Autoimmune Disorders

Falk Nimmerjahn

Antibody Fc: Chapter 11. Activating and Inhibitory Fc γ Rs in Autoimmune Disorders Falk Nimmerjahn
Autoimmune disorders are characterized by the destruction of self-tissues by the immune system. Multiple checkpoints are in place to prevent autoreactivity under normal circumstances. Co-expression of activating and inhibitory Fc receptors (FcRs) represents such a checkpoint by establishing a threshold for immune cell activation. In many human autoimmune diseases, however, balanced FcR expression is disturbed. Analysis of murine model systems provides strong evidence that aberrant FcR expression can result in uncontrolled immune responses and the initiation of autoimmune disease. This review summarizes these data and explains how this information might be used to better understand human autoimmune diseases and to develop novel therapeutic strategies.
